luffy declared a constructor (that is not the default one), and then used the default constructor assuming that the compiler would do it by itself.

```
aliedrees → \Projects\HW2_2526A\dry → (master) 551ms 8:06 AM
ali >> g++ *.cpp -o dryProgram
aliedrees → \Projects\HW2_2526A\dry → (master) 589ms 8:07 AM
ali >> ./dryProgram >> output.txt
```

```
1 Straw Hat crew contains:
2 Luffy Bounty: 1000000 (Devil Fruit: Gum Gum)
3 Zoro Bounty: 500000 (Devil Fruit: None)
```

$i * \text{width} + j$

$j * \text{width} + i$

$(i, j) \rightarrow \text{index?}$

	[1]	[2]	[3]	[4]
[0]	1			
[1]		1		
[2]				0
	[0]	[1]	[2]	[3]

Me trying to figure out if `(i, j)` is at `i \* width + j` or `j \* width + i` ... Just to print a single zero. ✨
